

导读:人文关怀是护理的本质和核心。日常工作中,广大护理人员基于华生博士关怀科学理论对患者实施人文关怀,提供有温度的护理。重大传染病如新型冠状病毒肺炎疫情发生时,患者面临更多痛苦和更大压力。同全球的护理人员一样,在中国,湖北武汉的护理人员及全国援鄂医疗队的护理专家和同道,以责任心、爱心,尽其所能,尽其所有,对患者实施多样化的人文关怀,彰显了护理专业的精髓和巨大价值,对今后护理的发展有重要启示。

Human caring for patients suffering from major infectious disease-nurses' entire use of self

Liu Yilan¹, He Jiao², Zhang Fengjian¹, Wang Shuang¹, Hu Deying¹, Jean Watson³

Abstract: Human caring is regarded as the essence and core of nursing. Based on Dr. Watson's human caring science theory, nursing staff in Wuhan Union Hospital and other healthcare institutions have delivered warm human caring service in patients' daily care. During the outbreak of major infectious disease-pandemic of COVID-19, patients are suffering from great psychological distress and pressure. Like nursing professionals around the world, nurses in Wuhan, Hubei, China, along with the colleagues from the National Aid Medical Team, used entire of themselves to conduct diversity human caring measures to patients suffering from the major infectious disease with love and responsibilities, which greatly demonstrated the essence and value of nursing care, and has wide implications for further development of nursing.

Key words: human caring; major infectious disease; nursing; COVID-19; caring relationship

The pandemic of COVID-19, the worst global infectious disease plague in the past hundred years, has posed a threat to safety, health and survival of all humankind^[1]. Besides physical discomfort, patients also reported and displayed emotional problems such as fear, anxiety, depression and more, even after hospitalization, because of isolation from the outside world and lack of family support^[2]. Thus, care givers faced unheard of challenges and an historic mission in the COVID-19 pandemic.

Nevertheless, since the origin of modern nursing from Nightingale onward, nursing has sustained the spirit of humanity, dedication, innovation and care of mind/body/spirit as a calling. Symbolic of the time, the British government named the improvised COVID-19 Square Cabin Hospital, the Nightingale Hospital. Still at this time, medical and nursing staff around the world are bravely fighting

this pandemic with devotion, amidst threats and danger every day.

In spite of this unimagined and unplanned situation with life threats to patients, caregivers, and global health, the nursing staff at hospitals in Wuhan, Hubei rose to the occasion with devoted commitment, from the beginning to the end of the pandemic. Additionally, 28,600 nurses rushed to Wuhan and Hubei under the call of the government, to help patients and staff in the comprehensive treatment and care of COVID-19 patients.

While nurses worldwide offered similar personalized, patient care practices, nurses in hospitals in Wuhan, taking Wuhan Union Hospital as example, were guided by the Philosophy and Theory of Human Caring. Examples of micro-caring practices, guided by the theory, include, but are not limited to the following:

- Nurses contacted patient's family for video visits.
- Nurses accompanied frightened patients by staying at their bedside.
- Nurses spontaneously offered and brought on their own, items such as fruit, clothes, shoes and other such supplies; personal offerings of support to patients in need.
- Birthday cakes were brought in to celebrate patient's birthday.

- Nurses used loving kindness language to encourage, help and comfort patients.
- Body language such as ‘loving heart-centered compassionate presence’ and non-verbal communication were used to repattern the field of anxiety and fear to one of calmness and serenity.
- Directors of nursing, demonstrated leadership by going to the bedside of patients and nurses in the front line, talking with them, touching them, preparing them, providing confidence and hope.
- Nursing staff engaged in full use of self and unique gifts and talents to authentically connect with the patients- for example, alleviating tension by singing, dancing, painting of the wall of the wards in order to make up for the distancing of the Personal Protective Equipment (PPE) and heavy protective clothing.
- Further, outside medical team nurses took the initiative to learn Wuhan dialect to better communicate with patients in dialect, surprised and pleased the patients unexpectedly.

Overall, these and many other creative, artistic, and imaginative micro- and macro-human caring nursing practices paint a beautiful picture and tapestry of loving-kindness and compassionate caring. This is very touching, but not surprising. With the strong base of Chinese traditional culture, i. e. , the benevolence of medicine, combined with international clinical scholarship of caring science and theory, the staff were more intentional and professional in their comprehensive approach to such a crisis of caring. As context for these micro-caring examples, Wuhan Union Hospital, for the past several years, has been developing its theory of human caring. Recent years, under the guidance and assistance of Dr. Watson and Watson Caring Science Institute^[3], the nursing leaders have developed systems in implementing human caring to patients^[4]. The human caring practice of the hospital as well as other hospitals in China is advancing and communicating with others in the international world, with mutual benefits and influence.

As a result of this history and background in caring science, the major infectious disease-COVID-19 ushered in a new chapter in the implementation of humanistic caring theory to practice in midst of most

dramatic threat to humanity. The nurses caring story took place on the battlefield in Wuhan as a testimony of patients receiving the finest of human caring to promote healing, harmonious, physical and spiritual comfort and recovery. Moreover, this professional practice contributed to nurses’ well-being, benefiting the caregivers themselves. The government of China affirmed the nurses through various forms of praise and recognition^[5]. Nurses’ sense of professional value and pride has been restoring to their soul and spirits during this world-wide challenge to patient care.

These human caring practices continue to have far-reaching significance and impact on COVID-19 patients and families. Nurses’ comprehensive practices of human caring have enriched the theoretical knowledge system of staff and have helped to promote the development of human caring nursing throughout China^[6-7]. It can serve as an exemplar and reference for future nursing leadership in caring education, clinical practice and managements around the world.
